To Whom It May Concern

As per my phone conversation-Note with the inspector on 10/30/2019, the inspector failed to mention the conversation that I mentioned about the feed lot has had environmental issues over the past 20 years. The Stant Feed Lot Operation was shut down at one point around 2003 to 2006. They had to build a lagoon for manure run off so it wouldn't destroy the nearby creek that flows through property feed lot operations. I also mentioned the manure reclamation in the south east corner of the property, with a pre-mix of material of lime, drywall, manure and it was rototilled together in row piles. This is still in the SE corner of the property. My concern is that the operations of the Stant feed lot didn't meet environmental regulations and are still ongoing. This is why the feed lot was running with less capacity of only 500 to 1000 head operations at the most. Again, I mention that over the past 20 years numerous acreages and farmers have recited in the area nearby. The improper removal of the runoff would cause our property values to decrease for the residents in the area. I had questions and concerns regarding rules and regulations of feed lot operations, that one quarter of land, (160 acres) of a feed lot must have another adjacent quarter land that is deeded to the same owner, so that they can properly disposal and maintain feeding standards.

Example: a 5000 head feed lot should have 5000 acres of deeded land to pasture or crop land to maintain feeding standards.

In my opinion, regardless of how much rented or leased land you have, you should have deeded land next to your feed lot operations.
